### **PEELING HEAD WITH DRIVE & ADJUSTMENT**

The peeling head has an adjustment made by the rotation of the inner ring.

As a result, a unique stability of the tool holder is achieved. These form a line with the mounted replaceable cutting inserts, the outer ring of the peeling head and the machine housing. As a result, the usual microvibrations are prevented. An absolute concentration of all four tool holders is achieved by dispensing with mechanical adjusting elements on the peeling head. The peeling head is driven by a high-performance gearbox. It is powered by a three-phase motor.
