SLIDE-IN DEVICE

The inserter consists of four large rolls driven by servomotors.

The drive takes place directly or via transfer case. This results in a precise synchronization of the material feed with the drawer. This is also driven by a servomotor. Hydraulic cylinders with servo valves ensure precise and powerful holding of the material to be peeled. The hydraulic pressure can be set from the control panel and is stored in the recipe control. Easy access to the rolls for quick change is given. A hydraulic clamping of the rolls is available as an option.
