2-ROLL STRAIGHTENING MACHINE SP FOR BLACK MATERIAL

The precision leveling machines can be used for the diameter range 10 to 250 mm.

They are used for straightening steel bars (hot rolled or forged). The height-adjustable two-roll straighteners have a fixed bottom roll and an adjustable top roll. The adjustments are carried out by motor. The adjustable components are hydraulically clamped. To compensate the unroundness existing in black material and the given rolling tolerances, the top roll has a hydraulic bearing. This will prevent machine damage. In addition, the introduced straightening force can be precisely directed and controlled.
